Automatic Dose Optimization for Radiotherapy

Problem Formulation
IMRT

Bixel values:

$$x_{i,j}^{\theta} \geq 0, \text{ for } \theta \in \Theta \text{ and } 1 \leq i,j \leq 20[1]$$

usually concatenated to a single bixels-value vector x.

Dose calculation:

$\mathbf{y} = L\mathbf{x}$ with L (pre-calculated) dose-influence (DI) matrix

---

[1]20x20 is a typical bixel discretization

Problem Formulation
IMRT (bis)

Objective (for *maximum* constraint c on structure s, dose d):

$$f_c(\mathbf{y}) = \frac{1}{|\mathcal{V}|} \sum_{v \in \mathcal{V}} (\mathbf{y}_v - d)_+^2$$

(reverse sign for minimal constraint)

Final objective:

$$f(\mathbf{y}) = \sum_{c \in \mathcal{C}} w_c f_c(\mathbf{y})$$

with w_c the weight of constraint c.
